

# VLNavigator

VersaLex Trader

## Multiple VLTrader and User Management

Included with VLTrader, VLNavigator facilitates grouping VLTraders into "pools", defining user groups with specific VLNavigator and VLTrader privileges, and creating individual user logins. By controlling which functions and areas a user can access, companies can improve security between departments or divisions and reduce the chance for user-related errors.

## Role-Based Accounts

VLTrader manages user accounts for security and privacy and also allows multiple VLTraders to be easily administered for greater scalability. VLTrader role-based accounts can be used where personnel with different responsibilities are accessing VLTrader.

## Managing User Groups

User privileges are established via user groups. A default administrators group is provided. A VLTrader user group can have specific privileges including both privileges related to managing multiple VLTraders and user management; and privileges related to accessing local listener, certificate management, scheduler, document routing, etc. A privileged item offers edit, view-only, or no access.

## Managing Multiple VLTraders

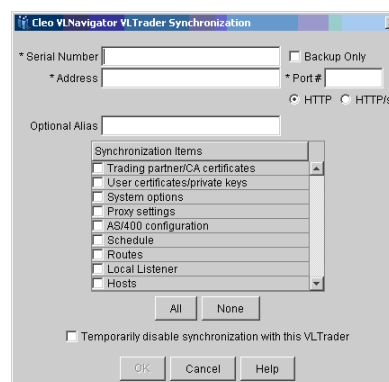

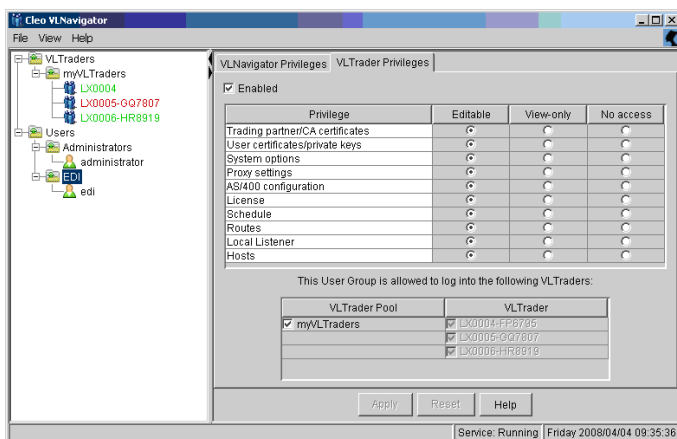

For multiple VLTrader environments, VLNavigator allows VLTraders to be logically grouped into pools. User groups are assigned access to either all VLTraders within a pool or individual VLTraders. Graphical reporting tabs show throughput for a VLTrader pool and individual VLTraders.

## User Group Access Levels:

- Edit
- View only
- No access

## User Group Privileges:

- Trading Partner/CA Certificates
- User Certificates/Private Keys
- System Options
- Proxy Settings
- AS/400 Configuration
- License
- Schedule
- Routes
- Local Listener
- Hosts

## Synchronizing multiple VLTraders

**Defining User Group Privileges: Administrators can control which functions users may manipulate.**
